

316 Plugs

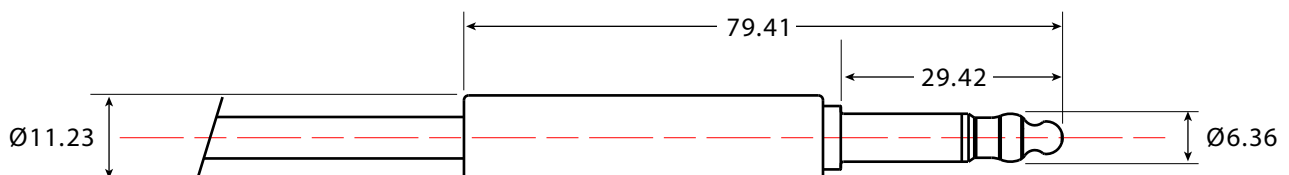

The Astralux three-way 316 'B' gauge plugs were familiar items on manual telephone switchboards until they were confined to the museums. However the plugs themselves are alive and well and to be found in a range of modern applications, notably in the broadcasting industry where they form a vital part of the complicated cord assemblies used in patching operations.

The Astralux 316 plugs are available with a variety of coloured covers for visual identification when patching. They can also be provided with loose covers and screws to enable easier fitting of cords if necessary.
